DFE 1800 SAS(SCS) Solution

版权所有©1993-2015 东方电子股份有限公司

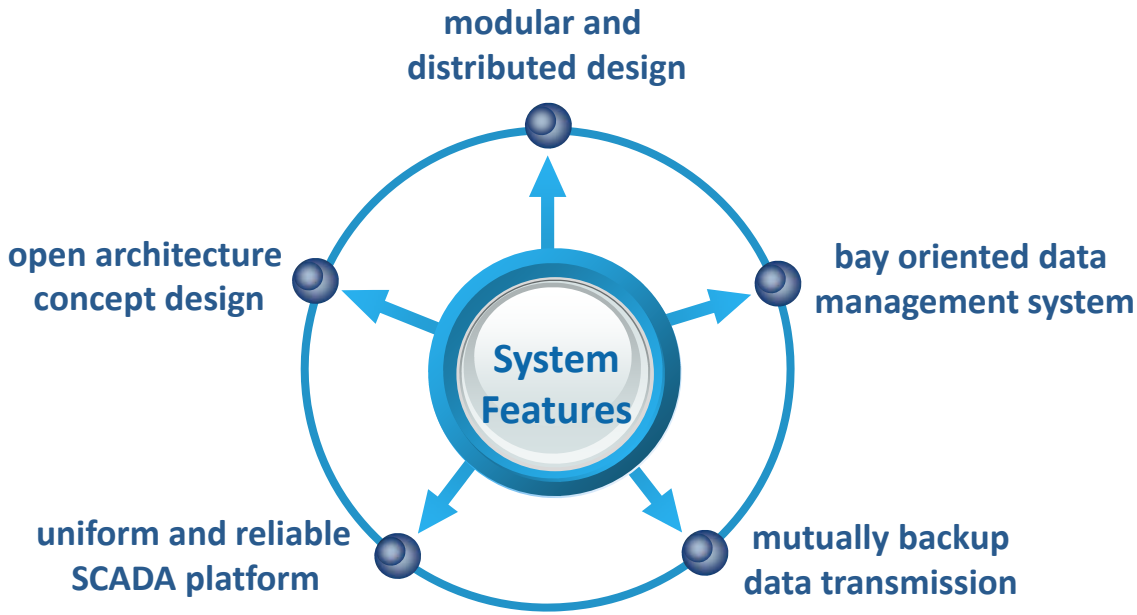

System Overview

- DF1800 SAS(SCS) system is developed by DFE based on its more than 20 years experience in power automation.
- The system has many useful functions, and is flexible in term of configuration, stable and reliable, easy to use and maintain.
- Suitable to be used for Substation Control System, Mini Master Station, from 6kV to 500kV system.
- Integrated multiple functions in one software, which includes: communication management, data acquisition, real time monitoring and control, protection relay management, and other application function.

System Features

Applied Standards

Standards stipulated by Standardized Organization:

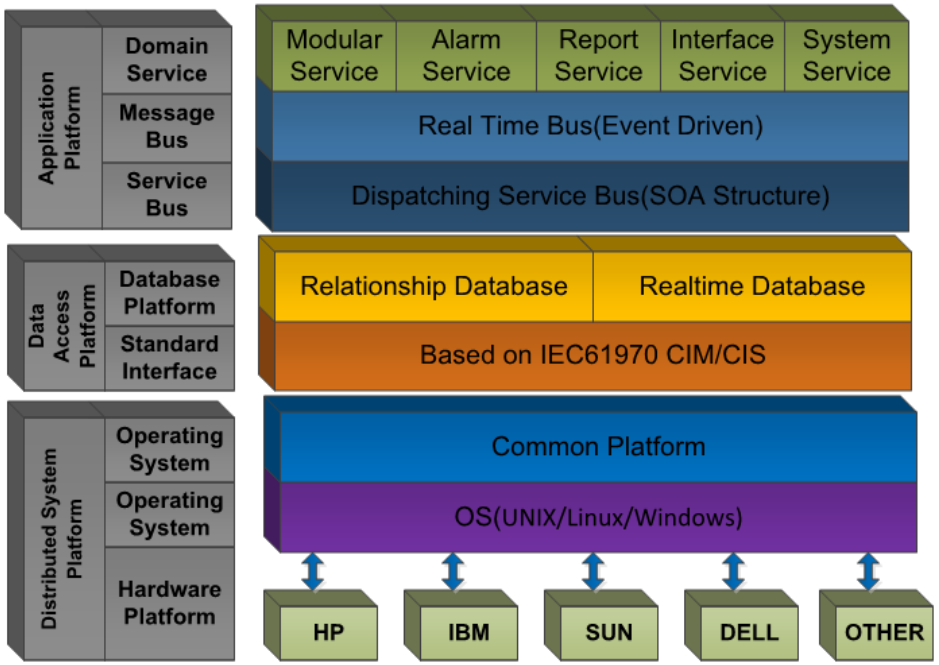

- ISO
- IEC
- ITU-T
- IEEE
- GB
- DL
- CCITT
- OMG

Actual industry standards :

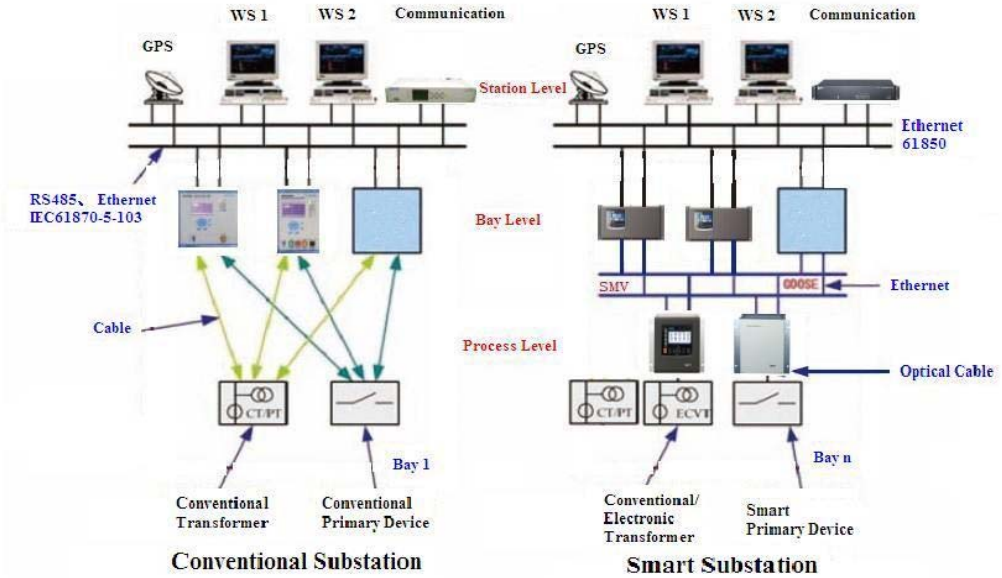

- IEEE POSIX
- IEEE OSF
- ANSI
- X-WINDOW
- OSF/MOTIF
- ANSI
- Open EMS
- CORBA

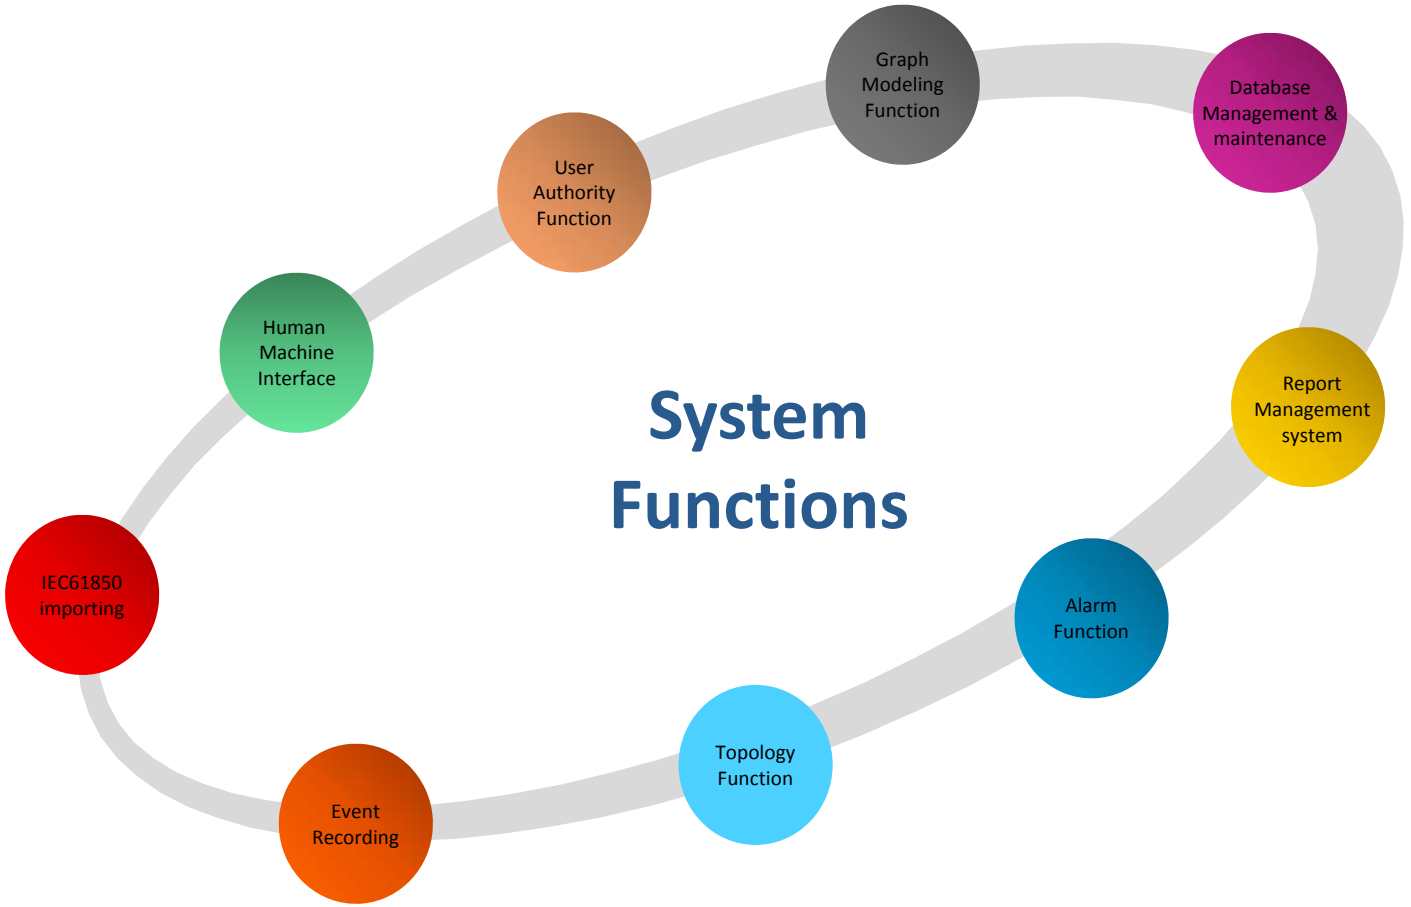

System Architecture

Hardware Configuration

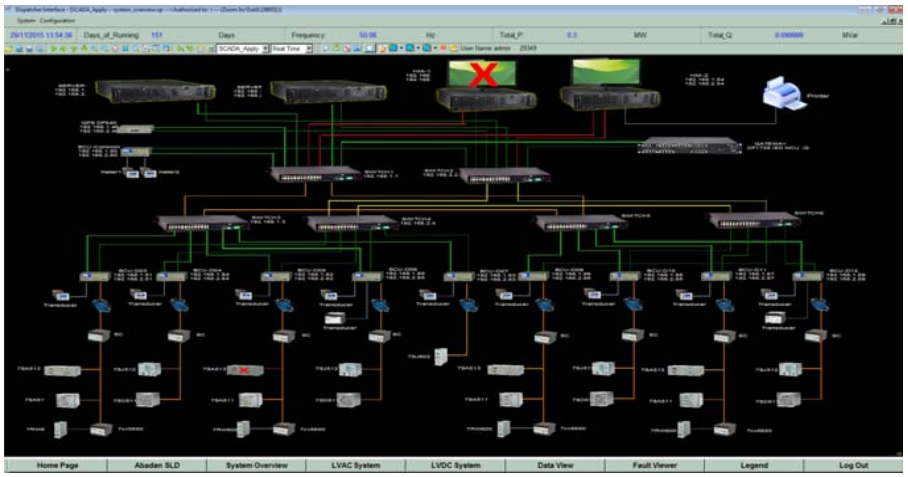

System Functions

System Functions

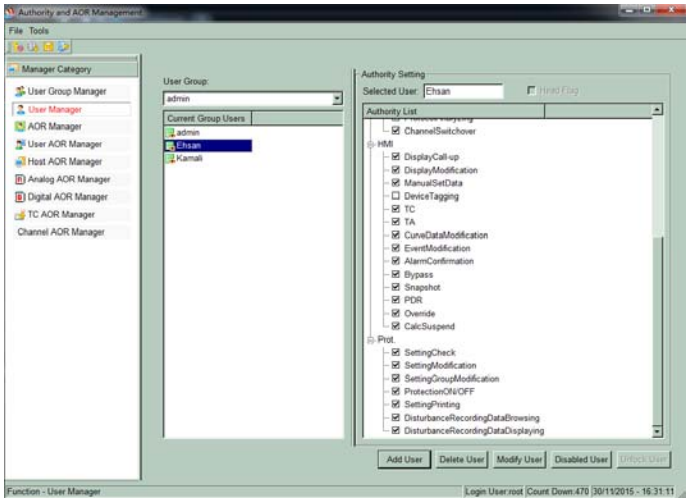

Human Machine Interface

The Human Machine Interface (HMI), based on X-Window and OSF/Motif or Windows, provides window management system, and offers unified styles and visual effect, plenty modes of information representation and varieties of convenient operations.

System Functions

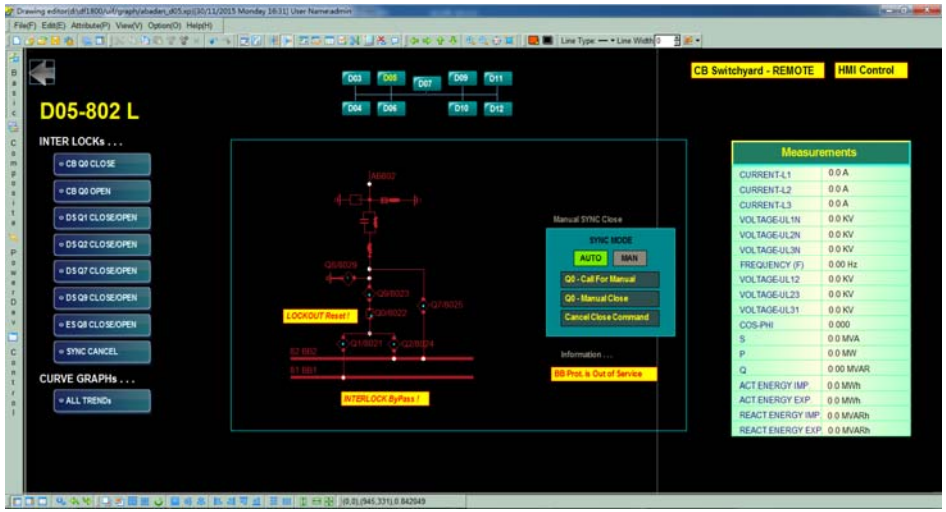

User Authority Function

With user authority function, the user could configurate the authority of user, and manage/ maintain the Area of Responsibility (AOR), and improve the security mechanisms of the system.

System Functions

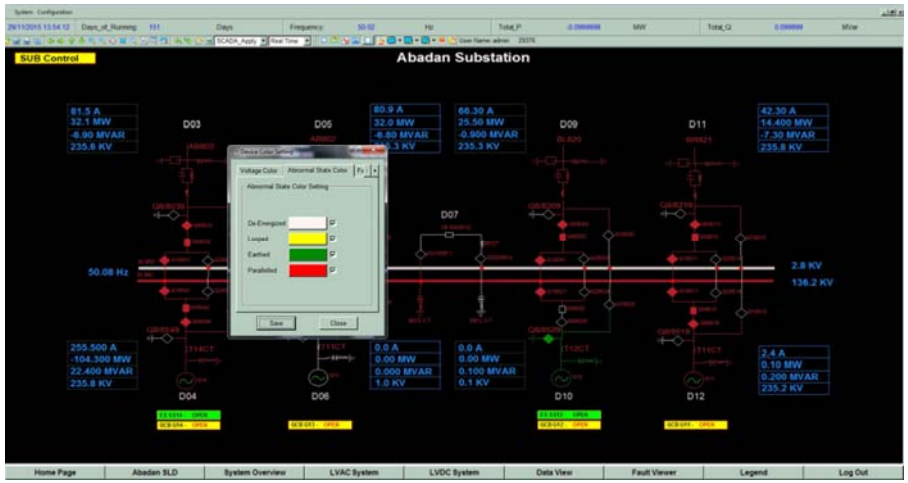

Graph Modeling Function

Graph Modeling function is based on the drawing-model-database integrated software. It could provide the user with easy-to-use feature, and to flexibly define power device primitive. With this function, the user can perform task of drawing easily.

System Functions

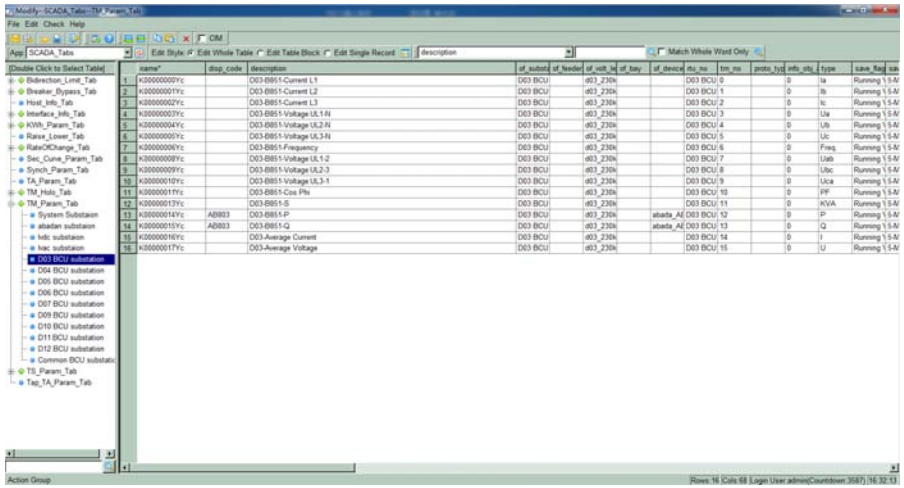

Topology Function

The topology function shall be determined from the status of all the switching devices such as circuit breaker, isolators etc. that affect the topology of the network modeled.

System Functions

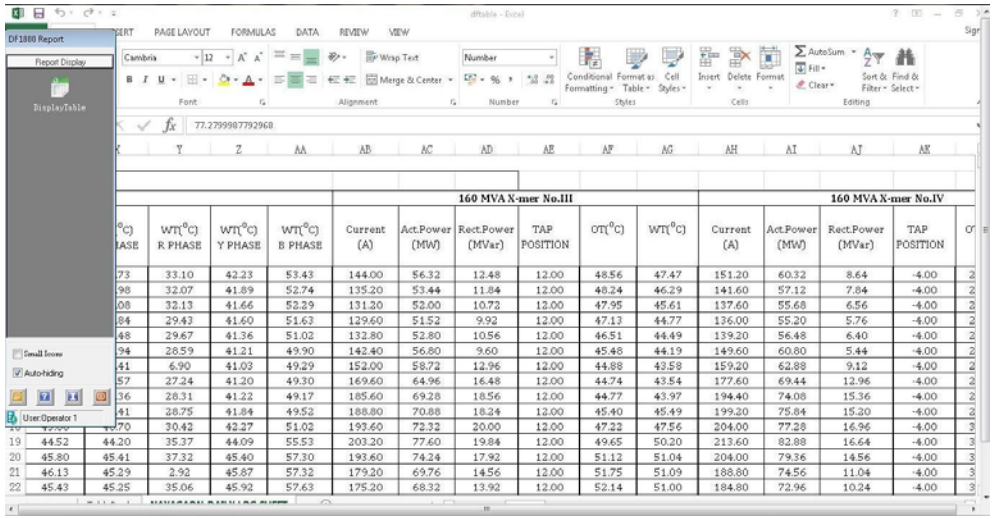

Database Management & Maintenance

The database management & maintenance function is database-oriented, in which the parameters in tables can be edited, modified and queried. The parameter can be initialized based on information of the external file or already existing table record, which shall simplify the input and improve the efficiency.

System Functions

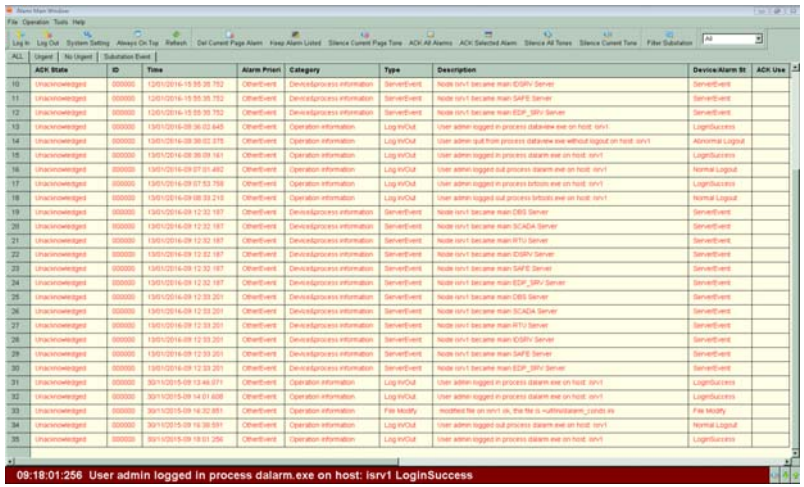

Report

With the report function, the user could display the template with history data about system operational state. Besides, the user could add, edit or modify the template.

System Functions

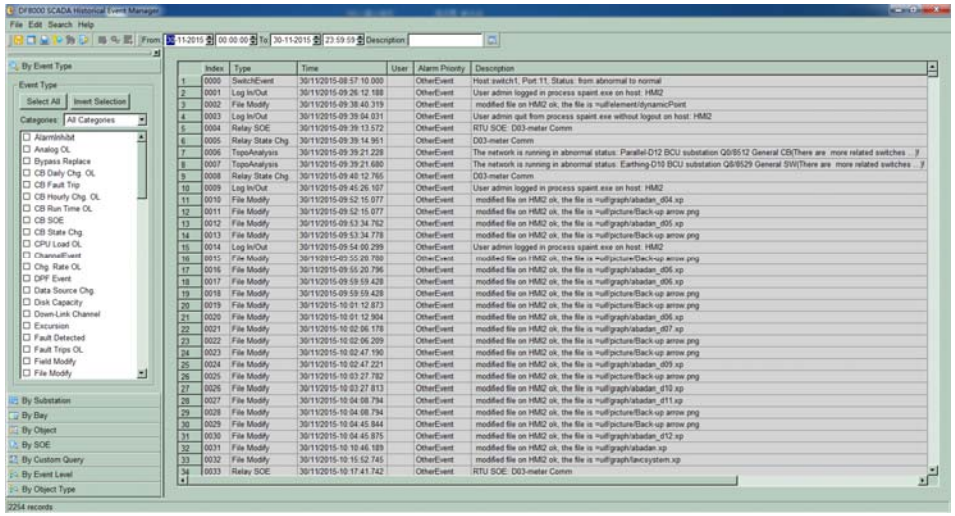

Alarm Function

With the alarm function, the user could notice the important operation information, and lighten the burden of dispatcher greatly. It would be of vital significance to ensure the power grid operation securely and reliably.

System Functions

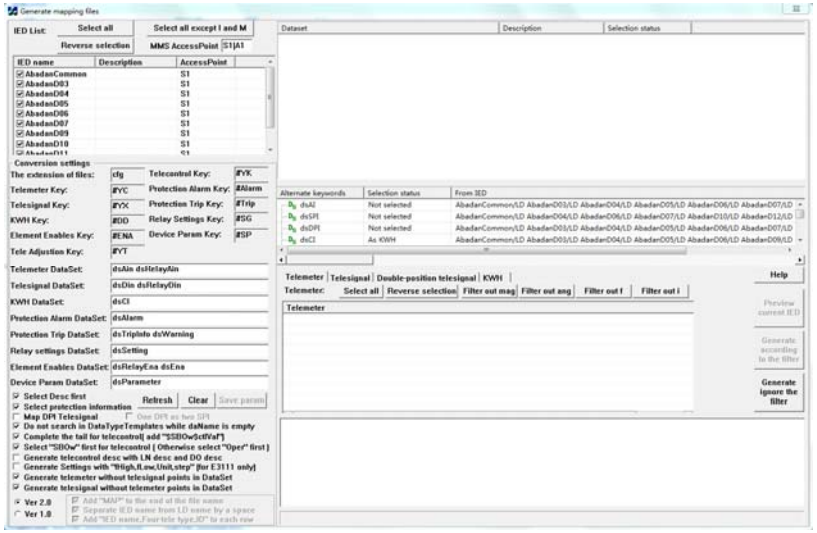

Event Recording

With the event recording function, the user could query all historical events and operation events of the system for any time period, and it available to edit the events listed based on the multiple combined conditions, which could be helpful in analyzing power grid operation and previous faults.

System Functions

IEC61850 Importing

Support IEC 61850 Standard, with which the system could carry out communication with IED smoothly.

Typical Cases

KZREC
Khorzarian Regional Electricity Company

Indonesia

Central Electricity Supply Utility of Odisha

Dakshin Haryana Bijli Vitran Nigam
Website-www.dhbvn.com

TAMIL NADU GENERATION AND DISTRIBUTION CORPORATION LIMITED
(TANGEDCO)

UPCL
Uttarakhand Power Corporation Ltd

GOVERNMENT OF PUDUCHERRY
ELECTRICITY DEPARTMENT

Utility

Punjab State Power Corporation Limited, Patiala
